2621

DATE MAILED: 06/06/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/649,260	Applicant(s) MILLER ET AL.	
	Examiner Christopher L. Lavin	Art Unit 2621	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 28 February 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) 14 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☒ Claim(s) 7 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 28 August 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Specification

1. Applicant is reminded of the proper language and format for an abstract of the disclosure.
2. The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.
3. The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.
4. The abstract of the disclosure is objected to because the abstract is supposed to be one paragraph. The applicant's abstract is four paragraphs. Correction is required. See MPEP § 608.01(b).

Claim Objections

5. The following quotations of 37 CFR § 1.75(a) is the basis of objection
 - (a) The specification must conclude with a claim particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention or discovery.

Claim 7 objected to under 37 CFR § 1.75(a) as failing to particularly point out and distinctly claim the subject matter which the applicant regards as his invention or discovery. The phrase "pre-established different ranges" makes little sense. It is assumed the applicant is claiming that only areas with tonal values meeting a requirement will be watermarked.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Claims 4, 5, 7, and 9 – 11 are rejected under 35 U.S.C. 102(e) as being anticipated by Rhoads (6,449,377)

8. In regards to claim 4, Rhoads discloses in the paragraph starting at column 4, line 31 that an image is divided up into regions (areas). In lines 42 – 45 in the same column Rhoads discloses that line widths can either be a specific value or a range of values. Inherent in the system disclosed by Rhoads is a means for determining areas which contain a line meeting the requirements needed to embed data otherwise the system disclosed by Rhoads would not work. Rhoads discloses (col. 4, line 66 – col. 5, line 17) that each area is analyzed to determine a scaling factor, which indicates how much data that area can take. This is a way of determining how to maximize watermark

energy in each area. As the only thing that is watermarked is the width of the line the analysis of how much the area can take must be based on the size range. The scaling factor allows for the maximum possible watermark intensity at each region, the only other item, besides line width, that would affect the scaling factor is a determination of how much artifacting the user wants. So the scaling factor is determined to limit artifacting at a particular level. The scaling factor is an associated intensity value. In column 4, lines 46 – 58 Rhoads discloses that a watermark is inserted into the image by modulating the width of the lines. Finally in the paragraph starting at column 4, line 64 Rhoads discloses that the intensity of the digital watermark is based on the scaling factor, which has already been shown to be an associated intensity value of each area.

9. In regards to claim 5, Rhoads discloses in lines 46 – 58 in column 4 that a watermark is applied by modulating the line width (“line is controllably varied”).

10. In regards to claim 9, Rhoads discloses in the paragraph starting at column 4, line 31 the step of dividing an image up into regions. In lines 42 – 45 in the same column Rhoads discloses that line widths can either be a specific value or a range of values. Claim 9 calls for “generating a watermark tile which will carry watermark data.” The so-called “watermark tile” in Rhoads is the “intermediate data signal” mentioned at column 5, line 7, which is multiplied by a scale factor for each region and then mapped to the region. The watermarking algorithm (column 5, line 18) generates the watermark tile, which carries the watermark data. Claim 9 further calls for “applying a digital watermark to said image in multiple areas...” The Rhoads patent meets that requirement too, as evidenced at column 5, lines 18 – 35. The digital watermark in

Art Unit: 2621

Rhoads takes the form of an increase or decrease in luminance for each region (or area) of the image. The watermarking algorithm clearly operates in multiple areas, namely areas A, C and D as discussed at column 5. Rhoads discloses in the same column in the paragraph starting at line 64 that the intensity of the digital watermark is controlled by binary data. Rhoads discloses (col. 4, line 66 – col. 5, line 17) that each area is analyzed to determine a scaling factor, which indicates how much data that area can take. This is a way of determining how to maximize watermark energy in each area. As the only thing that is watermarked is the width of the line the analysis of how much the area can take must be based on the size range. The scaling factor allows for the maximum possible watermark intensity at each region, the only other item, besides line width, that would affect the scaling factor is a determination of how much artifacting the user wants. So the scaling factor is determined to limit artifacting to a particular level.

11. In regards to claim 7, claim 7 is rejected for the same reasons as claim 9. The argument similar to that presented above for claim 9 is applicable to claim 7. Claim 7 distinguishes from claim 9 only in that it recites that the tonal values are limited to pre-established different ranges. The line widths are a measure of tonal value. The line width measurements must be taken to determine the scaling factors. An area with tonal value that is not satisfactory is given a scaling factor of zero, which means it is not changed, thus the tonal values are limited to pre-established ranges.

12. In regards to claim 10, claim 10 is the method claim of the system described in claim 4. Please see the rejection of claim 4.

13. In regards to claim 11, claim 11 is the method claim of the system described in claim 5. Please see the rejection of claim 5.

14. Claims 2, 13, 15, 16, and 18 are rejected under 35 U.S.C. 102(e) as being anticipated by Rhoads.

15. In regards to claims 2, 13, 15, 16, and 18 (only common features are discussed here further details for claims with more requirements are provided below), in the paragraph starting at column 7, line 34 Rhoads discloses that a watermarked image is scanned, creating a digital image. A digital image consists of an array of bits. Rhoads then discloses in the paragraph starting at column 4, line 31 that the image is divided into regions (tile sized areas). Rhoads discloses (col. 4, line 66 – col. 5, line 17) that each area is analyzed to determine a scaling factor, which indicates how much data that area can take. This is a way of determining how to maximize watermark energy in each area. As the only thing that is watermarked is the width (size) of the line the analysis of how much the area can take must be based on the width of the line. Line width, therefore, is a measure of tonal density. An area with tonal density that is not satisfactory is given a scaling factor of zero, which means it is not changed, thus the image is divided into secondary control areas where only regions able to be marked are part of the secondary control area. The scaling factor is the secondary controlling value, as it is used to set intensity. Further in lines 46 – 58 in column 4 Rhoads discloses that data is embedded in the image by changing line width. In the lines 42 – 45 at column 4 Rhoads discloses that line width can be specified at a particular size or can be varied (Range). Rhoads then specifies in the paragraph starting at column 4, line 59 that a

secondary control value (binary data) determines the content of the watermarked image.

16. In regards to claim 13, Rhoads discloses in the paragraph starting at column 4, line 25 that the image is line art.

17. In regards to claim 15, Rhoads discloses in the paragraph starting at column 4, line 25 that the image is line art.

18. In regards to claim 16, Rhoads discloses in lines 46 – 58 that an image is watermarked by modulating the line width.

19. In regards to claim 18, Rhoads discloses (col. 4, line 66 – col. 5, line 17) that each area is analyzed to determine a scaling factor, which indicates how much data that area can take. This is a way of determining how to maximize watermark energy in each area. As the only thing that is watermarked is the width of the line the analysis of how much the area can take must be based on the size range. The scaling factor allows for the maximum possible watermark intensity at each region, the only other item, besides line width, that would affect the scaling factor is a determination of how much artifacting the user wants. So the scaling factor is determined to limit artifacting at a particular level.

Claim Rejections - 35 USC § 103

20. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

21. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

22. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

23. Claims 1 and 3, and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rhoads in view of Todd.

24. In regards to claim 1, in the paragraph starting at column 7, line 34 Rhoads discloses that a watermarked image is scanned, creating a digital image. A digital image consists of an array of bits. Rhoads then discloses in the paragraph starting at column 4, line 31 that the image is divided into regions (tile sized areas). Further in lines 46 – 58 in column 4 Rhoads discloses that data is embedded in the image by changing line width. In the lines 42 – 45 at column 4 Rhoads discloses that line width can be

Art Unit: 2621

specified at a particular size or can be varied (Range). Rhoads then specifies in the paragraph starting at column 4, line 59 that a secondary control value (binary data) determines the content of the watermarked image. Rhoads, however, does not disclose that the image is divided into secondary control areas, where each control area covers a portion of the image with a characteristic that falls within a particular range.

25. Todd teaches in the steps for encoding algorithm in column 7 that the activity of a block is found in step 3 and then in step 5b that activity is used to mark secondary control areas. The activity is a measure of tone.

26. Therefore it would have been obvious to one having ordinary skill in the art at the time of the invention to use the secondary control areas as taught by Todd to encode data into an image and to use tone as a characteristic for picking secondary control areas. As Rhoads teaches data is embedded by varying line width. Areas that do not have lines or have too many lines would not be good candidates for the watermarking operation, so by marking the areas that have the characteristics needed for watermarking, processing time could be saved. Tone is a measure of activity, which is an indication of how much energy an area can hold. Knowing how much an area can be watermarked is useful as it helps to determine the maximum amount of information an image can hold.

27. In regards to claim 3, Rhoads discloses in the paragraph starting at column 4, line 64 that intensity is the control value. The binary data sequence is the intensity of the watermark at a particular secondary control area.

In regards to claim 17, claim 17 is rejected for the same reasons as claim 1. The argument similar to that presented above for claim 1 is applicable to claim 17. Claim 17 distinguishes from claim 1 only in that it recites "the secondary control value comprising an intensity associated with the tonal characteristic of the corresponding secondary control area". In lines 22 – 24 in column 6 Todd discloses that the magnitude (intensity) of the insertion can be varied according to the amount of activity in the block. Todd further discloses in the paragraph starting at column 2, line 3 that the watermark is placed so as not to be visible (no artifacting).

28. Claims 6 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rhoads in view of Schneider (6,404,908).

29. In regards to claim 6, Rhoads as shown above in the rejection of claim 4 discloses a system of watermarking an image having everything in common with claim 4 except for using a filter to find lines.

30. Schneider teaches in the column 6, line 25 that a filter can be used to detect lines.

31. Therefore it would have been obvious to one having ordinary skill in the art at the time of the invention to use a filter to detect lines so that data can be embedded in the lines. By using the technique taught by Schneider to detect lines far fewer calculations are required as documented in the paragraph starting at column 5, line 66 ("Thus, line detection algorithms in accordance with the preferred embodiments are capable of generating line and direction images using significantly fewer computations than prior art algorithms").

32. In regards to claim 12, claim 12 is the method claim of the system described in claim 6. Please see the rejection of claim 6.

33. Claims 8 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Todd in view of Dickey (4,231,656).

34. In regards to claim 8, Todd discloses in the Encoding Algorithm steps shown in column 7 that the image is divided into areas or masks (step 1). In step 3 the activity (tonal value) is found, then in step 5b masks with low activity are marked. Low activity requires that the activity fall within a range, Todd further details the distinguishing features between low activity and high activity in the paragraph starting at column 8, line 66. In lines 22 – 24 in column 6 Todd discloses that the magnitude (intensity) of the insertion can be varied according to the amount of activity in the block. Todd further discloses in the paragraph starting at column 2, line 3 that the watermark is placed so as not to be visible (no artifacting). Todd, however, does not disclose that a half tone image should be converted to line art before being watermarked.

35. Dickey teaches in the paragraph starting at column 4, line 14 that half-tone images can be converted into line art.

36. Therefore it would have been obvious to one having ordinary skill in the art at the time of the invention to convert a half-tone image into line art before performing the watermarking as disclosed by Todd. By converting a half-tone image into line art before watermarking it will be easier to fine lines to perform watermarking on.

37. In regards to claim 19, in lines 22 – 24 in column 6 Todd discloses that the magnitude (intensity) of the insertion can be varied according to the amount of activity in

the block. Todd further discloses in the paragraph starting at column 2, line 3 that the watermark is placed so as not to be visible (no artifacting). So the intensity is selected to maximize energy while avoiding visual artifacts.

Response to Arguments

38. Applicant's arguments filed 02/28/05 have been fully considered but they are not persuasive.

39. In regards to applicant's arguments that Todd does not teach "each secondary control area covering a portion of said image where a tonal density of said image falls within a particular range." Todd does teach this feature. Please see the rejection of claim 1.

40. The applicant's primary arguments center around the definition of tone. As the applicant does not define tone in the specification the examiner is free to interpret the word broadly. The examiner has interpreted tone as any measure of activity in an image and therefore Todd does teach measuring tone.

41. In regards to applicant's arguments over claims 6 and 12. Schneider's technique is only able to detect lines of a particular size, at some point the line thickness would get too large for Schneider to detect. The claim reads "means for determine areas of said image having lines within specific size ranges", not finding that size range with the filter. It has already been shown that Rhoads discloses measuring line sizes; Schnieder was used simply to show that filters can be used for line detection.

42. In regards to applicant's arguments over claim 7. Again the specification does not provide the definition that applicant appears to be using when defining tone, and therefore the examiner has interpreted tone to be a measure of any form of activity.

Conclusion

43. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christopher L. Lavin whose telephone number is 571-272-7392. The examiner can normally be reached on M - F (8:30 - 5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bhavesh M. Mehta can be reached on (571) 272-7453. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
